Vector Contour Windows Setup: quick start

Before you start

1. New PC: finish Windows setup and connect to Wi-Fi.
2. Plug in the USB stick with the **TECHNICAL DATA** folder (machine software installers are in `TECHNICAL DATA\SOFTWARE`, one folder per app). Any drive letter works.

Start the tool

Open **PowerShell as administrator** (Start, type PowerShell, right-click, Run as administrator), paste this and press Enter:

```
irm https://raw.githubusercontent.com/Vector-Contour/Windows-Setup/main/winsetup.ps1 | iex
```

Or double-click **VectorContourSetup.exe** and say Yes. (SmartScreen: More info, then Run anyway.)

Set up a machine PC (the usual job)

1. The window opens on the **Vector Contour** tab with **Machine PC** already picked.
2. Click **Preview first**: the log at the bottom lists what would change. Nothing is changed.
3. Untick anything you don't want. Open a section to edit folder names, paths or the USB location.
4. Click **Looks good, go**. Installers without silent switches open their own window: click through them.
5. Restart when the summary asks (Windows features and updates need it).

Running it again is safe: anything already done is skipped.

The other tabs

Tab	What it's for
Install	~240 apps. Tick, then **Install / upgrade selected**. Also: uninstall, upgrade all, show installed, WinGet or Chocolatey, add your own app.
Tweaks	Windows tweaks. **Standard** is a safe pick. **Run tweaks** or **Undo selected tweaks**. Switches on the right apply instantly. DNS, power plan, remove built-in apps.
Config	Windows features (.NET, Hyper-V, WSL...), fixes (Windows Update, network, system file repair) and shortcuts to old Control Panel pages.
Updates	**Security updates only** is recommended for machine PCs. Default puts Windows back; Turn off is for offline PCs only.
Folders	Folder templates and your own folder list.
Presets	Save what you ticked as a file to reuse on the next PC.

Good to know

- **Dry run** (top right) turns any button into a preview.
- **Run everything ticked on the tabs** runs all the tabs at once.
- A restore point is made before changes, so Windows can roll back.
- The Install, Tweaks, Config and Updates tabs come from Chris Titus Tech's WinUtil (MIT licence) and update themselves.
- Sensitive company files are not in the tool: copy them by hand.
